

# PHP - Echo & Print

In PHP the two basic constructs to get output are echo and print. we covered in this topic both type echo and print the following with syntax and it's example.

## Echo

echo() is not a function, it is a language construct therefore you can use it with and without parentheses for example echo and echo() the following syntax and example of echo.

### Example

```
<?php
    echo "This is Without Parentheses";
    echo ("This is With Parentheses");
?>
```

## Print

print it is a language construct therefore you can use it with and without parentheses for example print and print() the following syntax and example of print.

### Example

```
<?php
    print "This is Without Parentheses";
    print ("This is With Parentheses");
?>
```

## Difference Between Echo and Print

Sr.No	Echo	Print
1	Echo is a statement i.e used to display the output. it can be used with parentheses echo or without parentheses echo.	Print is a statement i.e used to display the output. it can be used with parentheses print( ) or without parentheses print.

<b>Sr.No</b>	<b>Echo</b>	<b>Print</b>
2	Echo can pass multiple string separated as ( , )	Using print can doesn't pass multiple argument
3	Echo doesn't return any value	Print always return 1
4	Echo is faster then print	Print slower than echo
