

# PHP - Indexed Array

A indexed array stores each array element with a numeric index. there are two methods to create a numeric array. the following example the index are automatically assigned.

```
<?php
    $number = array("one", "two", "three");
?>
```

The following example we assign the index manually.

```
<?php
    $number[0] = "one";
    $number[1] = "two";
    $number[2] = "three";
?>
```

The following example you access the variable values by referring to the array name and index.

```
<?php
    $number[0] = "one";
    $number[1] = "two";
    $number[2] = "three";
    echo $number[0]."-".$number[1]."-".$number[2]."and"."four";
?>
```

## Output

one-two-threeandfour
